Worksheet 8, Tuesday, November 11th, 2014

Definition: the **Definite Integral of** f from x = a to x = b is given by

$$(**) \int_{a}^{b} f(x) dx = \lim_{n \to \infty} \sum_{i=1}^{n} f(x_{i}) \Delta x$$
$$= \lim_{n \to \infty} \left[f(x_{1}) \Delta x + f(x_{2}) \Delta x + f(x_{3}) \Delta x + \dots + f(x_{i}) \Delta x + \dots + f(x_{n}) \Delta x \right]$$

Note: The definite integral is a limit of a sum! Just think about this formula as

the limiting value of the sum of the areas of finitely many (n) approximating rectangles.

To compute definite integrals the long (limit) way, follow these steps:

Step 1: Given the integral $\int_a^b f(x) dx$, pick off or identify the integrand f(x), and limits of integration a and b.

Step 2: Compute $\Delta x = \frac{b-a}{n}$. This width of each partitioned interval should be in terms of n.

Step 3: Compute $x_i = a + i\Delta x$. Leave the i as your counter. You have a from Step 1. You have Δx from Step 2. This endpoint x_i should be in terms of i and n.

Step 4: Plug x_i and Δx into the formula (**) above. Here it is again:

Step 5: Use the following formulas for sum of integers i and finish evaluating the limit in n.

$$\sum_{i=1}^{n} 1 = n$$

$$(*) \sum_{i=1}^{n} i = \frac{n(n+1)}{2}$$

$$(**) \sum_{i=1}^{n} i^{2} = \frac{n(n+1)(2n+1)}{6}$$

$$(***) \sum_{i=1}^{n} i^{3} = \left(\frac{n(n+1)}{2}\right)^{2}$$

Note: your final answer for the definite integral should be a **number** after you finish the limit.

1. **Read** through the entire next problem. Make sure you understand the formula to start, as well as the formulas for Δx and x_i . Because it doesn't feel natural yet, just trust the formulas right now.

Evaluate
$$\int_0^6 x^2 dx \text{ using Riemann Sums.}$$
Here $f(x) = x^2, a = 0, b = 6, \Delta x = \frac{b-a}{n} = \frac{6-0}{n} = \frac{6}{n} \text{ and } x_i = a+i\Delta x = 0+i\left(\frac{6}{n}\right) = \frac{6i}{n}.$

$$\int_0^6 x^2 dx = \lim_{n \to \infty} \sum_{i=1}^n f(x_i) \Delta x = \lim_{n \to \infty} \sum_{i=1}^n f\left(\frac{6i}{n}\right) \frac{6}{n}$$

$$= \lim_{n \to \infty} \sum_{i=1}^n \left(\left(\frac{6i}{n}\right)^2\right) \frac{6}{n}$$

$$= \lim_{n \to \infty} \left(\frac{216}{n^3} \sum_{i=1}^n i^2\right)$$

$$= \lim_{n \to \infty} \left(\frac{216}{6} \cdot \frac{n(n+1)(2n+1)}{n^3}\right) \text{ using } (**)$$

$$= \lim_{n \to \infty} \left(\frac{216}{6} \cdot \frac{n(n+1)(2n+1)}{n \cdot n \cdot n}\right)$$

$$= \lim_{n \to \infty} \left(\frac{216}{6} \cdot \left(\frac{n}{n}\right) \cdot \left(\frac{n+1}{n}\right) \cdot \left(\frac{2n+1}{n}\right)\right)$$

$$= \lim_{n \to \infty} \left(\frac{216}{6} \cdot 1 \cdot \left(1 + \frac{1}{n}\right) \cdot \left(2 + \frac{1}{n}\right)\right)$$

 $=\frac{216}{6}\cdot 1\cdot 2=\frac{216}{3}=\boxed{72}$

- 2. Evaluate $\int_0^4 x 1 \ dx$ using Riemann Sums and the Limit Definition of the Definite Integral.
- 3. Evaluate $\int_0^2 x^2 5x \, dx$ using Riemann Sums and the Limit Definition of the Definite Integral.
- 4. Evaluate $\int_{1}^{4} 6 3x \, dx$ using Riemann Sums and the Limit Definition of the Definite Integral.

Turn in your own solutions for Problems 2, 3, and 4.
