<center>u-substitution technique for Integration</center>

For this course we will have three main techniques of Integration.

         1. *We know it* base Snap facts (with single variables)
         2. Algebra, FOIL or *split-split* algebra
         3. u-substitution

The technique of u-subsitution is a temporary convenience that essentially **reverses the Chain Rule**.

Example: The Chain Rule yields

$$\frac{d}{dx}\sin\left(x^3\right) = 3x^2\cos\left(x^3\right) \qquad \text{which gives} \int 3x^2\cos\left(x^3\right)\ dx = \sin\left(x^3\right) + C$$

.
Q: How can we compute these complicated integrals with *nested* pieces?

• The substitution method *hides a nested* part of your integrand and aims to match the derivative piece at about the same time.
• We need to choose u to be a nested chunk of your integrand, pretty much a grab-of-sorts of the inside portion of a composed function.
• Once you choose u as some hidden chunk of your integrand, that will yield a certain derivative du. In the end, we want to choose a substitution u that simplifies the Integral **and** also matches a part as the derivative.

$$\int f'(\underbrace{g(x)}_{u})\cdot\underbrace{g'(x)\ dx}_{du} = \int f'(u)\ du = f(u) + C = f(g(x)) + C$$

<center>where
$\begin{array}{ll} u & = g(x) \\ du & = g'(x)\ dx \end{array}$
</center>

INDEFINITE Integrals: Always remember to add +C right away , as soon as you compute the Most General Antiderivative. The original variable always reappears when we re-substitute back for u.

Ex: $\displaystyle\int \underbrace{\underbrace{x^6}\ \left(\underbrace{x^7 - 9}_{u}\right)^8\ \underbrace{dx}}_{du} = \frac{1}{7}\int u^8\ du = \frac{1}{7}\left(\frac{u^9}{9}\right) + C = \boxed{\frac{\left(x^7 - 9\right)^9}{63} + C}$

$\begin{array}{ll} u & = x^7 - 9 \\ du & = 7x^6\ dx \\ \frac{1}{7}du & = x^6 dx \end{array}$

Ex: $\displaystyle\int \sin(\underbrace{6x}_{u})\ \underbrace{dx}_{\frac{1}{6}du} = \frac{1}{6}\int \sin u\ du = \frac{1}{6}\left(-\cos u\right) + C = \boxed{-\frac{1}{6}\cos(6x) + C}$

$\boxed{\begin{aligned} u &= 6x \\ du &= 6\ dx \\ \tfrac{1}{6}du &= dx \end{aligned}}$

Ex: $\displaystyle\int \frac{\overbrace{\sec^2 x}^{du}}{\sqrt{\underbrace{5 + \tan x}_{u}}}\ \overbrace{dx} = \int \frac{1}{\sqrt{u}}\ du = \int u^{-\frac{1}{2}}\ du = \frac{u^{\frac{1}{2}}}{\frac{1}{2}} + C = 2\sqrt{u} + C = \boxed{2\sqrt{5 + \tan x} + C}$

$\boxed{\begin{aligned} u &= 5 + \tan x \\[6pt] du &= \sec^2 x\ dx \end{aligned}}$

Ex:
$$\int \frac{5}{x^2\left(8 + \dfrac{2}{x}\right)^3}\ dx = -\frac{5}{2}\int \frac{1}{u^3}\ du = -\frac{5}{2}\int u^{-3}\ du = -\frac{5}{2}\left(\frac{u^{-2}}{-2}\right) + C$$

$$= \frac{5}{4u^2} + C = \boxed{\frac{5}{4\left(8 + \dfrac{2}{x}\right)^2} + C}$$

$\boxed{\begin{aligned} u &= 8 + \frac{2}{x} \\ du &= -\frac{2}{x^2}\ dx \\ -\tfrac{1}{2}du &= \frac{1}{x^2}\ dx \end{aligned}}$

Ex:
$$\int \frac{7}{\sqrt{x}\left(3 + \sqrt{x}\right)^2}\ dx = 7\int \frac{1}{\sqrt{x}\left(3 + \sqrt{x}\right)^2}\ dx = 14\int \frac{1}{u^2}\ du = 14\int u^{-2}\ du$$

$$= 14\left(\frac{u^{-1}}{-1}\right) + C = -\frac{14}{u} + C = \boxed{-\frac{14}{3 + \sqrt{x}} + C}$$

$\boxed{\begin{aligned} u &= 3 + \sqrt{x} \\ du &= \frac{1}{2\sqrt{x}}\ dx \\ 2du &= \frac{1}{\sqrt{x}}\ dx \end{aligned}}$

DEFINITE Integrals: Recall, you must change (or temporarily mark) your Limits of integration. The variables and Limits of Integration change *simultaneously.* Once you *switch* your Limits of Integration to u-values, then the original variable never reappears.

Ex:

$$\int_{\frac{\pi}{6}}^{\frac{\pi}{3}} \frac{\sin x}{\cos^3 x}\, dx = -\int_{\frac{\sqrt{3}}{2}}^{\frac{1}{2}} \frac{1}{u^3}\, du = -\int_{\frac{\sqrt{3}}{2}}^{\frac{1}{2}} u^{-3}\, du = -\left(\frac{u^{-2}}{-2}\right)\Big|_{\frac{\sqrt{3}}{2}}^{\frac{1}{2}} = \frac{1}{2u^2}\Big|_{\frac{\sqrt{3}}{2}}^{\frac{1}{2}}$$

$$= \frac{1}{2\left(\frac{1}{2}\right)^2} - \frac{1}{2\left(\frac{\sqrt{3}}{2}\right)^2} = \frac{1}{2\left(\frac{1}{4}\right)} - \frac{1}{2\left(\frac{3}{4}\right)} = \frac{1}{\frac{1}{2}} - \frac{1}{\frac{3}{2}} = 2 - \frac{2}{3} = \frac{6}{3} - \frac{2}{3} = \boxed{\frac{4}{3}}$$

$$\boxed{\begin{aligned} u &= \cos x \\ du &= -\sin x\, dx \\ -du &= \sin x\, dx \end{aligned}} \text{ and } \boxed{\begin{aligned} x = \frac{\pi}{6} &\Rightarrow u = \cos\left(\frac{\pi}{6}\right) = \frac{\sqrt{3}}{2} \\ x = \frac{\pi}{3} &\Rightarrow u = \cos\left(\frac{\pi}{3}\right) = \frac{1}{2} \end{aligned}}$$

Ex

$$\int_{-\frac{\pi}{3}}^{\frac{\pi}{2}} \sin(3x)\, dx = \frac{1}{3}\int_{-\pi}^{\frac{3\pi}{2}} \sin u\, du = -\frac{1}{3}\cos u\Big|_{-\pi}^{\frac{3\pi}{2}}$$

$$= -\frac{1}{3}\cos\left(\frac{3\pi}{2}\right) - \left(-\frac{1}{3}\cos(-\pi)\right) = -0 + \frac{1}{3}(-1) = \boxed{-\frac{1}{3}}$$

$$\boxed{\begin{aligned} u &= 3x \\ du &= 3\, dx \\ \tfrac{1}{3}du &= dx \end{aligned}} \text{ and } \boxed{\begin{aligned} x = -\frac{\pi}{3} &\Rightarrow u = 3\left(-\frac{\pi}{3}\right) = -\pi \\ x = \frac{\pi}{2} &\Rightarrow u = 3\left(\frac{\pi}{2}\right) = \frac{3\pi}{2} \end{aligned}}$$

Here is an example of an *inverted* or *reverse* substitution

Ex:

$$\int x\sqrt{x+1}\, dx = \int (u-1)\sqrt{u}\, du = \int u^{\frac{3}{2}} - u^{\frac{1}{2}}\, du = \frac{2}{5}u^{\frac{5}{2}} - \frac{2}{3}u^{\frac{3}{2}} + C$$

$$= \boxed{\frac{2}{5}(x+1)^{\frac{5}{2}} - \frac{2}{3}(x+1)^{\frac{3}{2}} + C}$$

$$\boxed{\begin{aligned} u &= x+1 \Rightarrow x = u-1 \\ du &= 1\, dx \end{aligned}}$$
